Aggregates

Sourced from crushers in Wada, Paya, Kalyan and Uran, Marmopedia offers a wide range of aggregate materials. Aggregates are granular materials that are used with a cementing medium to form concrete or hydraulic mortar. They also decrease the consumption of cement and water and contribute to the mechanical strength of the concrete, making them an indispensable ingredient in the construction and maintenance of rigid structures. Marmopedia continuously seeks new ways to use aggregates to improve drainage, heat absorption, and other forces that impact the environment. We trade into aggregate plants having both the technology as well as the operational and technical capacity to develop products that meet the requirements and specifications of our clients. Marmopedia crushers have a capacity of more than 250 TPH per plant that helps us focus on quality and innovation.

Types

Aggregates 10MM | Aggregates 20MM | Crushed Sand | Washed Sand | River Sand

Brands

Wada | Pahya | Kalyan| Turbhe | Navi Mumbai | Gujarat
